

HABITAT LOSS

By Conn

HABITAT LOSS

Imagine what happens when an animal goes extinct... What will happen to the creatures it eats? Suddenly, they have no predator.

Over time, those creatures spread out of control. And animals that relied on the extinct species for food now cannot eat.

The balance of life is broken. And any changes in the food chain ultimately affect all species on this planet... including humans.

Also, habitat loss can have a significant effect on the economy.

The economy?

What do think will happen when the resources humans need to survive are all destroyed? People can't sell items they can't make. And people who live in polluted areas are sicker.

How can I help combat habitat loss?

I'm glad you asked!

Back at home

First, avoid eating too much dairy, meat, and bakery products with palm oil. Only buy foods with ingredients that are grown on sustainable farms.

Then, write to others about the problem, and tell them to do the same.

You can also donate money to organizations that work to stop habitat loss.

I see. Thank you for explaining what habitat loss is. I guess I need to be more mindful about the things I buy.

No problem.

Sure!

I made dinner. Oh, you can stay a little bit if you want.

It's a vegetarian meal

Hey, Aiden. Do you know what climate change is?

The End
